Employer Job Profile Builder

1. Job description

Harbor Light Clinics (sample, invented)
Harbor Light runs 14 outpatient clinics and needs an analyst to turn appointment and billing data into weekly reports for clinic managers.
Must have: 2+ years of SQL (window functions, joins on large tables); strong Excel skills; experience building dashboards in Power BI or Tableau; ability to explain findings to non-technical managers.
Good to have: Python (pandas) for data cleaning; knowledge of healthcare data privacy basics; experience with before-and-after analysis of process changes.
We are a friendly, ambitious team looking for someone with great attitude and attention to detail.
Hybrid work, 3 days in the office.

2. Requirements

Check these before anything else. Everything below is built on them. (Model use: 25241 tokens in, 4046 tokens out.)

ID	Requirement	Importance	Quote from the job description
R1	2+ years of SQL (window functions, joins on large tables)	mandatory	*“2+ years of SQL (window functions, joins on large tables)”*
R2	strong Excel skills	mandatory	*“strong Excel skills”*
R3	experience building dashboards in Power BI or Tableau	mandatory	*“experience building dashboards in Power BI or Tableau”*
R4	ability to explain findings to non-technical managers	mandatory	*“ability to explain findings to non-technical managers”*
R5	Python (pandas) for data cleaning	preferred	*“Python (pandas) for data cleaning”*
R6	knowledge of healthcare data privacy basics	preferred	*“knowledge of healthcare data privacy basics”*
R7	experience with before-and-after analysis of process changes	preferred	*“experience with before-and-after analysis of process changes”*

ID	Requirement	Importance	Quote from the job description
R8	great attitude and attention to detail Needs your review: The terms 'great attitude' and 'attention to detail' are subjective and not easily verifiable on a CV. The employer could clarify specific behaviors or examples that demonstrate these qualities.	preferred	*"great attitude and attention to detail"*

Things to review

- error P2 bullet 2 is nearly identical to P1 bullet 2. Write a different achievement.

3. Reference projects

Illustrative examples of the experience this job needs. Candidates are compared on the evidence signals, not on matching the project names.

P1. Weekly Appointment Data Compilation Automated

Work experience

Illustrative reference project - all figures are examples

Clinic staff manually compiled appointment data into Excel sheets each week. This process took 10 hours per week and often resulted in errors.

SQL Excel Python (pandas) Power BI

Constraints

- Data volume: 100,000 rows per week
- Deadline: reports due every Monday morning
- Compliance: HIPAA regulations for patient data

How it was built

SQL queries extracted data from the database, Python cleaned and transformed it, and Power BI generated the final reports.

CV bullets

- Wrote SQL queries with window functions to extract and aggregate appointment data, cutting data retrieval time from 121 to 59 minutes (-51%)
- Cleaned and transformed data using Python (pandas), reducing error rate from 4 to 0.8 errors per week (-80%)
- Built interactive dashboards in Power BI, increasing report generation speed from 12 to 18 hours per week (+50%)

Example figures

- data retrieval time: 121 → 59 minutes (-51.2%)
- error rate: 4 → 0.8 errors per week (-80%)
- report generation speed: 12 → 18 hours per week (+50%)

Evidence signals (what a candidate would need to show)

- Wrote complex SQL queries with window functions to aggregate appointment data
- Used Python (pandas) to clean and transform data, handling missing values and outliers
- Built interactive dashboards in Power BI with filters and drill-down capabilities
- Conducted before-and-after analysis to measure the impact of automation on data retrieval time and error rate

- Ensured compliance with HIPAA regulations throughout the data processing pipeline

Covers requirements: R1 R2 R5 R7

P2. Billing Data Inconsistencies Resolved and Automated

Work experience

Illustrative reference project - all figures are examples

Clinic staff manually reviewed and corrected billing data inconsistencies each week, spending 8 hours per week on this task. This process led to delays in report generation and reduced trust in the data accuracy.

SQL Excel Power BI Python (pandas)

Constraints

- Data size: 100,000 rows per week
- Deadline: Reports needed within 48 hours of data collection
- Compliance: Adherence to healthcare data privacy standards

How it was built

SQL queries were used to identify and correct data inconsistencies, Python (pandas) was used for data cleaning, and Power BI was used to build interactive dashboards for reporting.

CV bullets

- Wrote SQL queries to identify and correct billing data inconsistencies, cutting data review time from 8 to 2 hours per week (-75%)
- Cleaned and transformed data using Python (pandas), reducing error rate from 9 to 1.8 errors per week (-80%)
- Built interactive dashboards in Power BI, increasing report generation speed from 12 to 18 hours per week (+50%)

Example figures

- data review time: 8 → 2 hours per week (-75%)
- error rate: 9 → 1.8 errors per week (-80%)
- report generation speed: 12 → 18 hours per week (+50%)

Evidence signals (what a candidate would need to show)

- Wrote SQL queries with window functions to identify billing data inconsistencies
- Used Python (pandas) for data cleaning and transformation
- Built interactive dashboards in Power BI for reporting
- Ensured adherence to healthcare data privacy standards during data handling
- Conducted before-and-after analysis to measure the impact of process changes on data quality
- Presented findings to non-technical managers in a clear and concise manner

Covers requirements: R3 R4 R6

P3. Analyzing Patient Demographics Impact on Clinic Operations

Academic project

Illustrative academic reference project - example only

To understand how patient demographics influence clinic operations, a student analyzed a public healthcare dataset containing 500,000 patient records from various clinics.

SQL Excel Power BI

Constraints

- Worked with a large dataset containing 500,000 patient records.
- Completed the project within a 4-week timeframe.

How it was built

SQL was used to extract and clean the data, Excel for initial analysis and visualization, and Power BI to build interactive dashboards.

CV bullets

- Wrote SQL queries to extract and clean demographic data from the dataset.
- Used Excel to perform initial analysis and create visualizations of demographic trends.
- Built interactive dashboards in Power BI to present findings and allow for further exploration of the data.

Readiness

This project was built to demonstrate the ability to analyze complex datasets, perform data cleaning and transformation, and create insightful visualizations to communicate findings to non-technical audiences.

Evidence signals (what a candidate would need to show)

- Wrote SQL queries to extract demographic data from a large dataset.
- Cleaned and transformed data using SQL to prepare it for analysis.
- Used Excel to perform statistical analysis and create visualizations of demographic trends.
- Built interactive dashboards in Power BI to present findings and allow for further exploration of the data.
- Documented assumptions and limitations in a README file to provide context for the analysis.

Covers requirements: R1 R2 R3
